

InsightAI Feature Guide

Complaint intelligence for classify, review, and SLA tracking.

Version 2.1 - demo walkthrough for operators and stakeholders.

1. What InsightAI does

Upload a CSV of complaint texts. The model classifies each row into Billing, Shipping, Service, or Technical, scores confidence, and flags low-confidence rows for human review. Analytics track volume, mix, resolution SLAs, and system alerts.

2. Quick demo path

- Download sample CSV from the sidebar (48 held-out complaints).
- Click Upload, select the file, then Ingest data.
- Wait for the job to complete, then open Overview.
- Triage Needs Review items, then explore filters and Live Classify.

3. Overview

KPI cards: total complaints, resolved under 24h, needs-review count, and median resolution time. Semantic colors (red/amber) appear only for risk states on Needs Review - not decoration.

System alerts highlight actionable anomalies (review overload, weak class confidence, SLA risk).

Charts: colored category bars plus a donut mix so volume share is obvious at a glance. Recent ingestion jobs sit beside the charts with export and retry when a run fails.

If Needs Review is above zero, use Triage pending reviews to jump straight into the Review Queue.

4. Review Queue

Lists low-confidence complaints, lowest confidence first. Click a row to open Triage. The dropdown defaults to the model suggestion so you can Approve / Submit in one click when the label is correct, or change the category when it is not.

Each submit clears needs_review and marks the row human_reviewed so Overview can show how many labels you corrected for future retraining.

When the queue is empty, return to Overview for refreshed KPIs.

5. Complaint Explorer

Search and filter by category, review status, and sort. Export CSV uses the active filters. Pagination sits under the table.

6. Live Classification

Paste any complaint (or pick a sample chip) and Classify. The result card shows the primary category badge, confidence percent with a bar, and runner-up alternatives so you can see model uncertainty live.

7. Sidebar

- Status dot: API online/offline.
- Download sample CSV: safe demo file (not the training set).
- Feature guide PDF: this document.
- Upload + Ingest: start a classification job.
- Settings: optional API key when AUTH_ENABLED=true.
- Footer: app version and loaded model tag.

8. Data notes

sample_upload.csv is held-out demo text. complaints.csv is for training only (python -m ml.train). Do not upload the training file as a demo.
